

# Segmented card

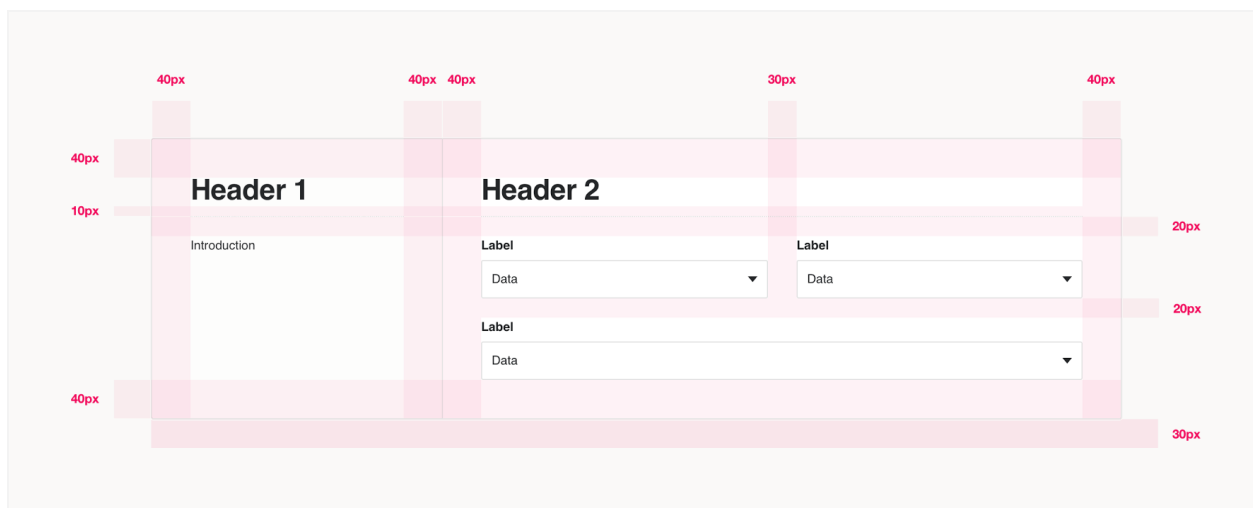

A segmented card is used for displaying and sorting editable content. They are mostly made up of form elements, divided into two segments to allow for division of content to guide the user through the experience.

## Specifications

- Each card has a 2px border-radius.
- Each card has a 1px solid border, in the *Gray 300* color.
- If multiple cards are stacked, there should be a 30px margin separating them.
- Each card is divided into two segments:
  - Left segment is 30% width.
  - Right segment is 70% width.
  - Both segments have 40px padding.
  - Left segment has a 70% opacity on it's white background color, to create a subtle hierarchy (read left-to-right) and to distinguish it from the right segment.

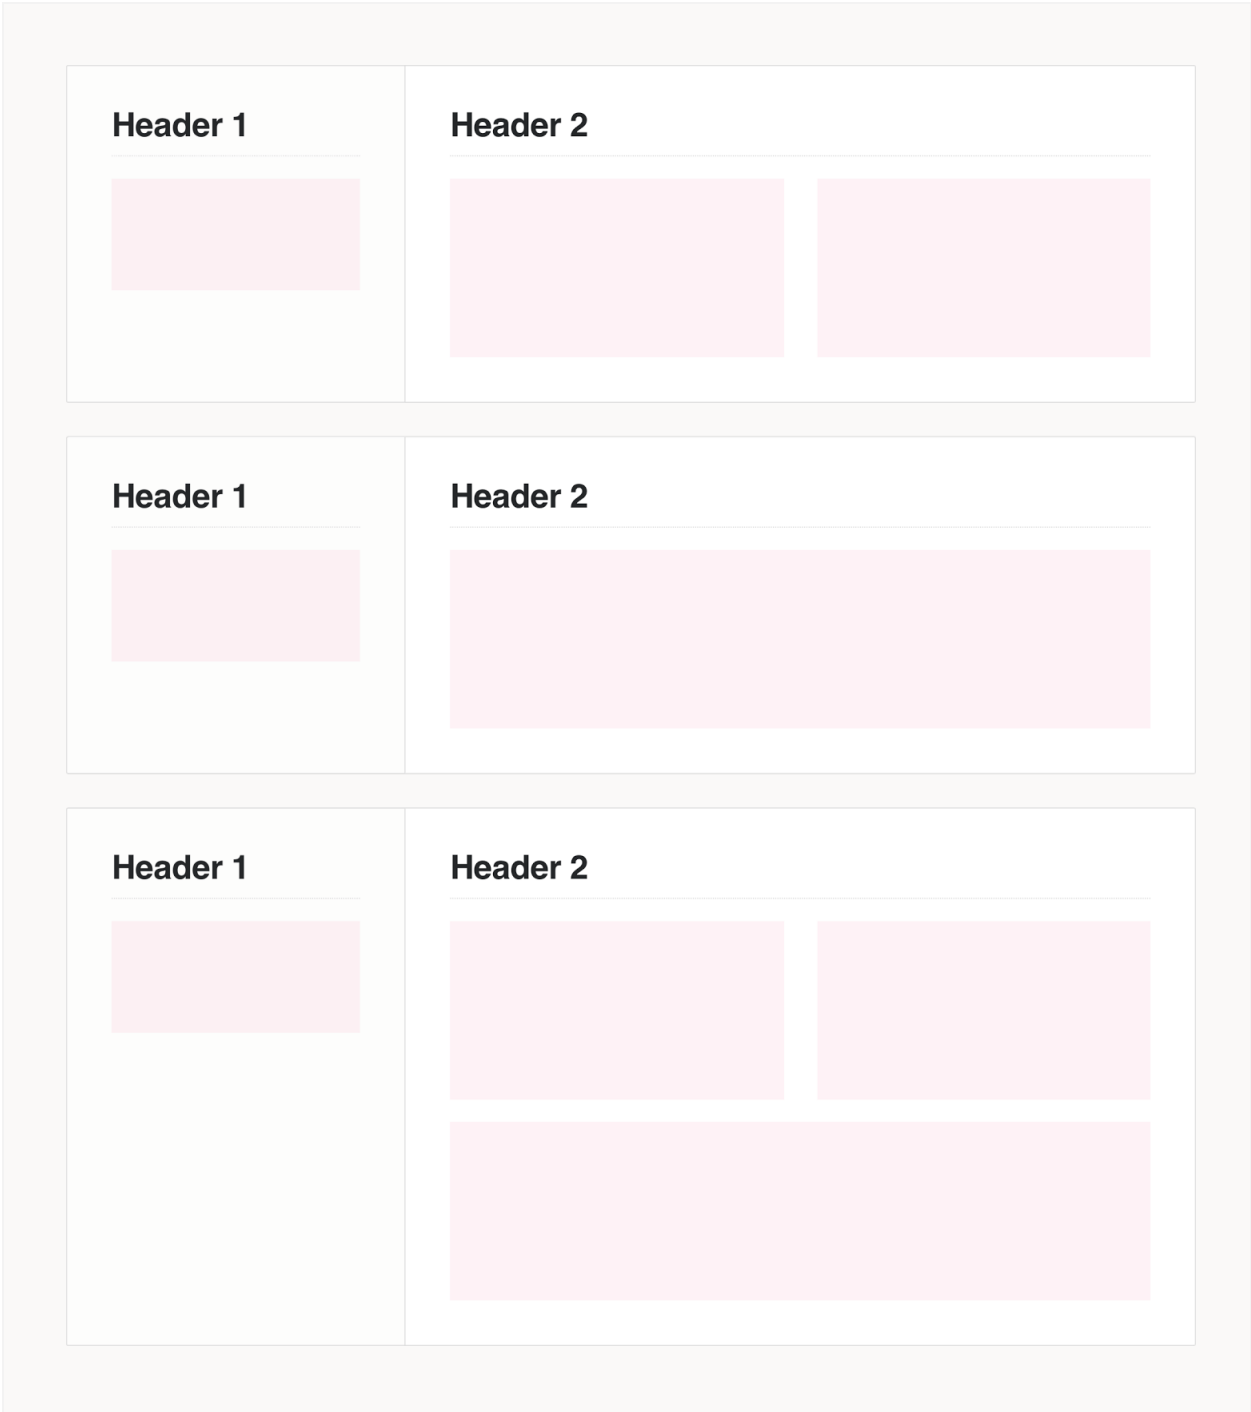

## Components

- For main headers in each column use the *Bold 3* font style.
- Each main header has a dotted divider 10px below it.
- For all copy use the *Regular 2* font style.
- The right segment can contain a combination of any form inputs.

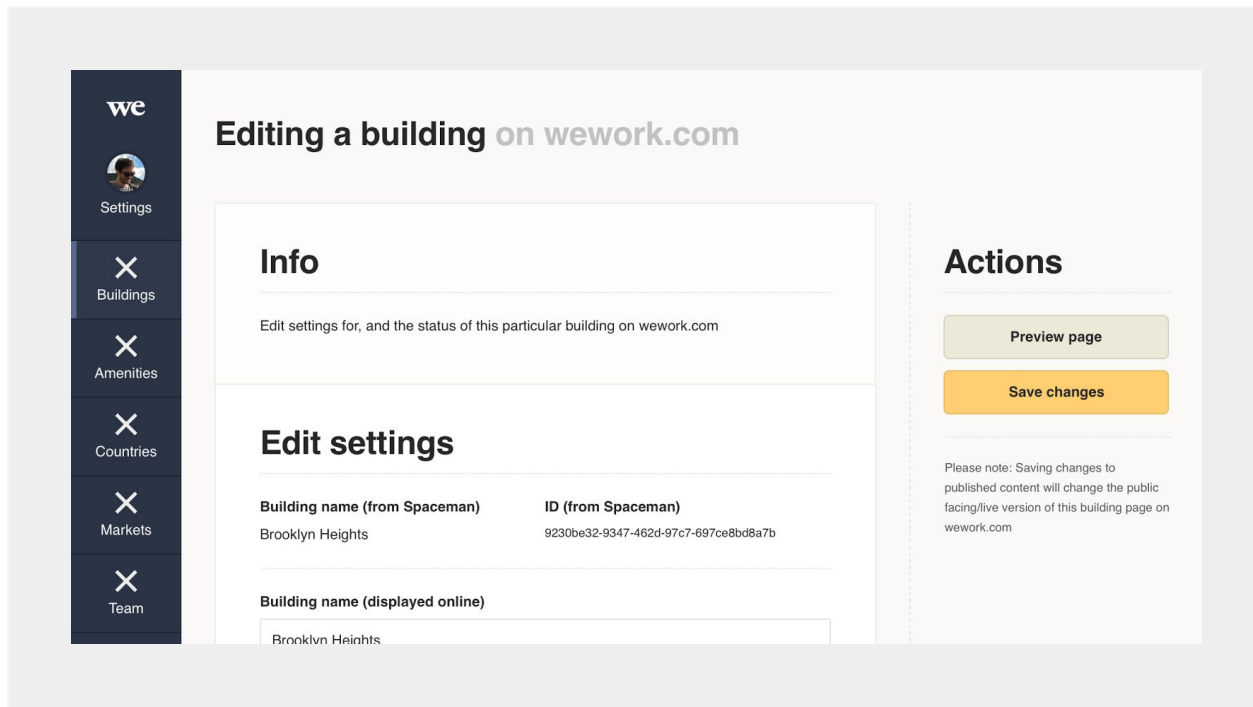

**Flexible layouts**

Form elements in the right segment can be divided into two (equally distributed) columns with a gutter of 30px between each column. This allows you to cluster related form inputs, or to better suit form inputs with a small character limit. Form elements that need to contain more characters are better suited to fill/span 100% width (one column) of the right segment. The two can be mixed to good effect (see the examples below).

## Responsive

The segmented card stacks at smaller browser widths, with the right segment dropping below the left segment, as opposed to aside it.

## Example uses

Below are a few examples of good use cases for the segmented card.

## Descriptive

In the example below the left segment is used to introduce what this segmented card is about — in this case what do the form fields to the right allow you to edit.

<h3>Content</h3> <p>Edit useful information specific to this building and it's locale.</p>	<h3>Edit building info</h3> <table><tr><td><b>Primary market</b></td><td><b>Phone number</b></td></tr><tr><td>Select a market... ▼</td><td>Leave blank if not applicable</td></tr><tr><td colspan="2"><b>All markets to appear</b></td></tr><tr><td colspan="2">Add multiple markets... ▼</td></tr><tr><td colspan="2"><a href="#">Add new market</a></td></tr><tr><td colspan="2"><b>Building description</b></td></tr><tr><td colspan="2">Write a description for this building...</td></tr></table>	<b>Primary market</b>	<b>Phone number</b>	Select a market... ▼	Leave blank if not applicable	<b>All markets to appear</b>		Add multiple markets... ▼		<a href="#">Add new market</a>		<b>Building description</b>		Write a description for this building...	
<b>Primary market</b>	<b>Phone number</b>														
Select a market... ▼	Leave blank if not applicable														
<b>All markets to appear</b>															
Add multiple markets... ▼															
<a href="#">Add new market</a>															
<b>Building description</b>															
Write a description for this building...															

## Helpful

In the below example, the editable content in the right segment requires a little more 'hand-holding', so the left segment includes a helpful "Tip".

<h3>SEO</h3> <p><b>Tip</b> Be mindful of the 'keywords' you use in the page title and description. Think about what people will be searching for in Google to find this page (e.g. 'coworking', 'Chelsea', 'New York City', 'close to L subway', 'Manhattan' etc...)</p>	<h3>Edit meta info</h3> <p>The meta information is what shows up in search engine results. The page title should be short and on point. The page description should be no more than one or two lines.</p> <table><tr><td><b>Page title</b></td></tr><tr><td>Brooklyn Heights Coworking Office Space   WeWork</td></tr><tr><td><b>Page description</b></td></tr><tr><td>Write page description here...</td></tr></table>	<b>Page title</b>	Brooklyn Heights Coworking Office Space   WeWork	<b>Page description</b>	Write page description here...
<b>Page title</b>					
Brooklyn Heights Coworking Office Space   WeWork					
<b>Page description</b>					
Write page description here...					

## Supportive, non-editable content

In the two examples below the left segment is used for non-editable information relevant to the editable content in the right segment. The division of editable and non-editable content can be useful.
